Part 1: Pattern Recognition

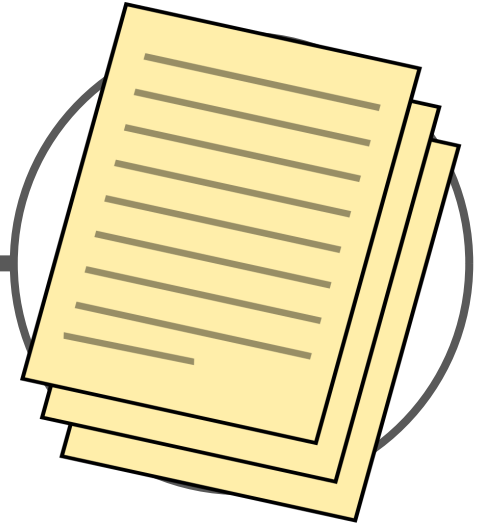
© 2020 The Atticus Project

Overview of Steps

Input

Machine Learning Model

Output



Input

The input is data that has been "pre-processed", or prepared into a format that AI can use, usually by humans usinga simple program

Text is converted into a string of characters or words

Images are converted into arrays of pixels

In the picture, pixel colors are convertedinto three values represe

Machine Learning Model

The model utilizes

Pattern Recognition

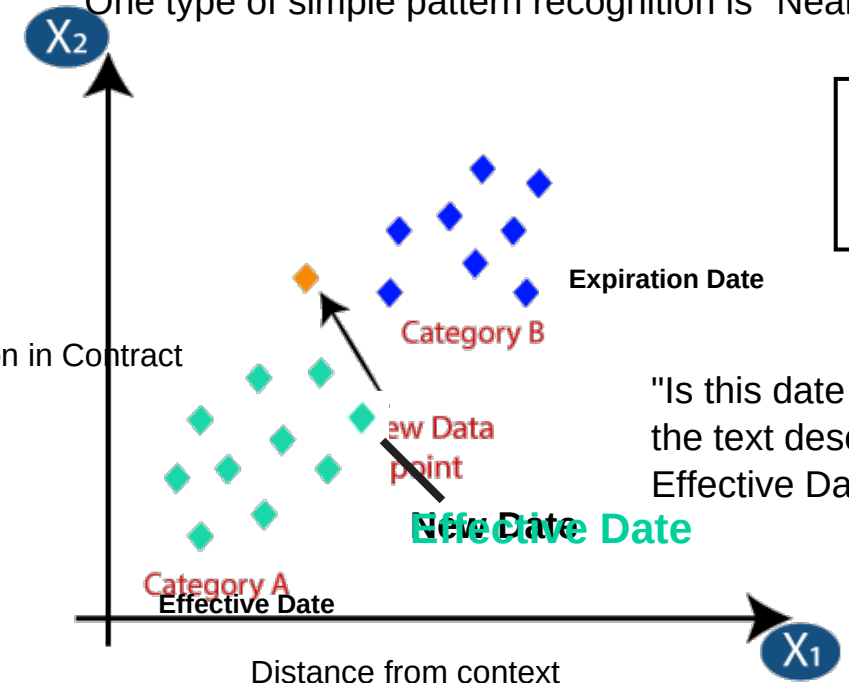
to predict and classify data inputs.

Pattern Recognition

Recognize patterns in data

Group and classify data points based on features

One type of simple pattern recognition is "Nearest Neighbor"



The Nearest Neighbor search looks through the existing data points for the closest one to the new data point.

Use Cases:

Plagiarism detection

Spell-check

"Is this date in the contract more close to the text describing an Expiration Date or Effective Date?"

Pattern Recognition (cont.)

Example:Classification based on contract clauses

An Anti-Assignment clause means the contract can't be assigned without consent or notice.

A Change of Control clause is a type of Anti-Assignment clause where assignment would include a change in control of a contracting party.

Anti-Assignment

Change of Control
